TITLE : STORAGE BOX FOR BODY RISING UP
FROM UNDERGROUND AND MEMBER
FOR POSITIONING STORAGE BOX

ABSTRACT : PROBLEM TO BE SOLVED: To enhance the working efficiency by providing a cover at the top end of a cylindrical storage part arranged on the upper side of a bottom base for forming an insertion hole for a rise-up body, and by providing a ring-like member adapted to be inserted in the insertion hole, and a support plate formed therein with a support hole through which the rise-up body is passed.

SOLUTION: An end part of a rise-up body 1 is subjected to a predetermined process and is then fitted in a support hole 14 in a support plate 13 and in a ring-like member 12. An intermediate cylinder 4 is interposed between a cylindrical cover 5 and a bottom base 3, and is fastened by a coupling bolt 6. A main body A is brought above the rise-up body 1, and is set so that an insertion hole in the bottom base 3 is fitted on the ring-like member 12. Thereafter, the ring-like body 12 is removed, and a gap for discharging trapped water is defined between the support plate 13 and the insertion hole. The outer peripheral surface of the support plate 13 is bulged out in a conical shape or the like so as to adapt to the application to a slope. Accordingly, since the working is carried out in a condition in which a storage box body has been assembled, it is possible to enhance the working efficiency, and to prevent vibration from being transmitted to the rise-up body 1.
